

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions of claims in the application:

Listing of Claims:

1. (Currently Amended) An automation security system, comprising:
an asset component that defines an industrial automation device;
an access component, encoded in a computer-readable storage medium, that defines a security attribute associated with the industrial automation device, the security attribute including a location attribute and a time attribute, that grants access to the industrial automation device for a predetermined amount of time; and
a security component, encoded in a computer-readable storage medium, that regulates access to the industrial automation device based upon the security attribute and includes ~~an automated~~ security assessment component that performs automated security threat analysis based in part on the modeling of the industrial automation device, a network access type and at least one of a formal threat analysis, a vulnerability analysis, a factory topology mapping, or an attack tree analysis to determine whether access should be granted to the industrial automation device.
2. (Cancelled)
3. (Cancelled)
4. (Previously Presented) The system of claim 1, the security component is based on at least one of automation and process control security, cryptography, and Authentication/Authorization/Accounting (AAA).
5. (Previously Presented) The system of claim 1, the asset component describes at least one of factory components and groupings, the factory components are at least one of sensors, actuators, controllers, I/O modules, communications modules, or human-machine interface (HMI) devices.

6. (Previously Presented) The system of claim 5, the groupings include factory components that are grouped into at least one of machines, machines grouped into lines, or lines grouped into facilities.
7. (Currently Amended) The system of claim 5, the groupings have associated severity attributes ~~such as~~ including at least one of risk and security incident cost.
8. (Original) The system of claim 7, further comprising an ISA S95 Model for Enterprise to Control System Integration to integrate security aspects across or within respective groupings.
9. (Currently Amended) The system of claim 1, further comprising a set of generic IT components and specification of values for[[es]] parameters required to assemble and configure the IT components to achieve flexible access to the industrial automation device.
10. (Previously Presented) The system of claim 9, the IT components include at least one of switches with virtual local area network (VLAN) capability, routers with access list capability, firewalls, virtual private network (VPN) termination devices, intrusion detection systems, AAA servers, configuration tools, or monitoring tools.
11. (Original) The system of claim 1, further comprising security parameters and policies that are developed for physical and electronic security for various component types.
12. (Previously Presented) The system of claim 11, the security parameters and policies further comprising at least one of security protection levels, identification entry capabilities, integrity algorithms, or privacy algorithms.
13. (Previously Presented) The system of claim 1, the security component includes at least one of authentication software, virus detection, intrusion detection, authorization software, attack detection, protocol checker, or encryption software.

14. (Previously Presented) The system of claim 13, the security component at least one of acts as an intermediary between an access system and one or more automation components, or facilitates communications between the access system and the one or more automation components.
15. (Previously Presented) The system of claim 1, the security attributes are specified as part of a network request to gain access to the at least one industrial automation device, the security attributes included in at least one of a group, set, subset, or class.
16. (Original) The system of claim 15, the security component employs at least one authentication procedure and an authorization procedure to process the network request.
17. (Previously Presented) The system of claim 16, further comprising one or more security protocols including at least one of Internet Protocol Security (IPSec), Kerberos, Diffie-Hellman exchange, Internet Key Exchange (IKE), digital certificate, pre-shared key, or encrypted password, to process the network request.
18. (Previously Presented) The system of claim 15, further comprising at least one of an access key or a security switch to control network access to a device or network.
19. (Previously Presented) The system of claim 18, the access key further comprises at least one of time, location, batch, process, program, calendar, or GPS (Global Positioning Information) to specify local and wireless network locations, to control access to the device or network.

20. (Withdrawn) An automation security system, comprising:
a server that manages a network interface between networked industrial automation devices and other devices attempting access to the networked industrial automation devices; and
a security management module associated with the network interface that enforces an enterprise wide policy and that manages security threats directed to the networked industrial automation devices, the enterprise wide policy including a location attribute and a time attribute that limits access to the networked industrial automation devices to certain time periods, and utilizes the results of automated security threat analysis.
21. (Withdrawn) The system of claim 20, the security management module at least one of schedules audits, establishes a security policy, applies the policy from a single or distributed console, or generates reports that identify potential weaknesses in security.
22. (Withdrawn) The system of claim 20, the security management module provides an interface to at least one of add, delete or modify security rights of an individual, a group, or a device or distribute security information to various controllers and control devices.
23. (Withdrawn) The system of claim 20, further comprising at least one of:
an authentication with the server to establish a secure link;
a secure link to authenticate and authorize access to a requestor of the networked industrial automation device; or
establishment of a secure session with the requestor if access is authorized.

24. (Withdrawn) An automation security methodology, comprising:
- electronically analyzing an industrial automation device;
 - programmatically modeling the industrial automation device in accordance with network security considerations, the network considerations include a location attribute and a time attribute that controls if and how long network access is granted to the industrial automation device; and
 - automatically developing a security framework for an automation system based in part on the modeling of the industrial automation device, a network access type and at least one of a formal threat analysis, a vulnerability analysis, a factory topology mapping, or an attack tree analysis to determine whether access should be granted to the industrial automation device.
25. (Cancelled)
26. (Withdrawn) The method of claim 24, the one or more security attributes further comprise at least one of a role, an asset type, a location, a time, or an access type.
27. (Withdrawn) The method of claim 24, further comprising at least one of:
- determining whether to grant access to the industrial automation device;
 - granting access from the industrial automation device; or
 - granting access from a network device associated with the industrial automation device.

28. (Withdrawn) An automated security system for an industrial control environment, comprising:

means for defining one or more security attributes associated with at least one network request, the security attributes include at least one of:

- a location attribute,
- a time attribute,
- a role attribute, or
- an access type attribute;

means for processing the one or more security attributes;

means for automatically determining which network devices require security resources based on at least one of a formal threat analysis, a vulnerability analysis, a factory topology mapping, or an attack tree analysis; and

means for controlling access to at least one of a network device or the industrial automation component based in part on the one or more security attributes.

29. (Withdrawn) A security schema for a factory automation system, comprising:

a first data field that describes industrial automation devices;

a second data field that describes security parameters for the industrial automation devices, the security parameters including a location attribute and a time attribute that enables access to the industrial automation devices for a specified time and attributes stemming from the results of automated security risk analysis; and

a schema that associates the first and second data fields, the schema employed to limit access to the industrial automation devices based upon the security parameters.

30. (Withdrawn) The system of claim 29, the schema including at least one of an access role, an asset type, an access type, time information, address information, or location information.

31. (Withdrawn) The system of claim 29, further comprising a response schema to provide status to a requesting network device.

32. (Withdrawn) The system of claim 31, the response schema including at least one of a status field, a time field, an access type field, an access location field, or a key field.

33. (Withdrawn) The system of claim 31, the response schema including an attachment field to indicate other security data follows the response schema.
